Academic Projects

With a goal of advancing STEM (Science, Technology, Engineering, and Math) education, research, collaboration, and outreach, the University of Wisconsin-Milwaukee's Kenwood campus is a multiple-phase initiative to build a new interdisciplinary science quad. The new Kenwood Interdisciplinary Research Complex (IRC) is the first of several new buildings and provides spaces for research, instruction, and collaboration This five-story structure houses a variety of facilities for the physics department including instrumentation research labs, a data center, conference rooms, and offices.

Flad Role Full architectural services | **Size** 143,500 square feet | **Completion** 2015 | **Awards** LEED Gold, IIDA Wisconsin, Award of Excellence – Educational/Institutional/Liturgical; In Business Magazine Commercial Design Awards for Best New Development or Renovation – Education, Best Green-Built Project, and Project of the Year; Milwaukee Business Journal Real Estate Awards, Best New Development or Renovation – Education; The Daily Reporter, Top Projects of 2015

Founded in 1883, the Department of Biochemistry at the University of Wisconsin is built on a foundation of important breakthroughs that have shaped our molecular understanding of basic biological problems. As the department has expanded in both size and influence, so too have its facilities and the very nature of the program, embracing an ever-widening diversity of scientific collaborations across disciplines. Today the research and instructional buildings on the Biochemical Sciences Complex bring together undergraduates, graduate students, and staff from several departments in the College of Agricultural and Life Sciences and the Medical School.

Flad Role Full architectural services | **Size** 169,200 square feet (new), 100,400 square feet (renovation) | **Completion** 2012 | **Awards** 2014 AIA WI Honor Award, 2015 ASLA Wisconsin Chapter Merit Award for Biochemistry Mall, The Daily Reporter Magazine Top Projects of 2012, IIDA Wisconsin 2013 First Place – Educational/Institutional

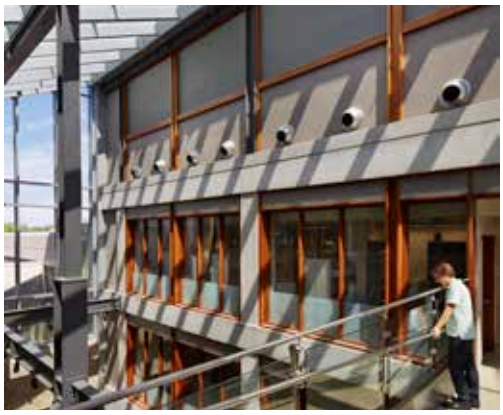

Opened to the public in 1977, the Seeley G. Mudd Library for Science and Engineering has served the Northwestern campus for over 40 years. Its original open design has adapted well to changing technology and program needs; however, to ensure continued growth into the future, the university commenced a state-of-the-art gut renovation and expansion that will see the facility into the next generation. The project adds two floors to the original three-story structure along with a substantial expansion that wraps the building on two sides, approximately tripling the original square footage. This additional space expands the building's use to include science and engineering research and office space as well as the science and engineering library. The new facility design aims to achieve LEED-NC Silver certification.

Flad Role Full architectural services | **Size** 188,000 square feet | **Completion** 2017 | **Awards** 2018 AIA Wisconsin Merit Award, 2018 IIDA Wisconsin Award of Excellence – Educational/Institutional/Liturgical

Northwestern's Technological Institute is one of the largest academic buildings in the world, with close to one million square feet of classrooms, offices, laboratories, and research facilities. Over the last 75 years, the building has undergone countless renovations and additions to accommodate the ever-evolving scientific community at Northwestern University. For the latest expansion, Flad Architects designed four infill additions that reside between the building's existing wings. The exterior facades keep with the original 1942 design and utilize lannon stone and window patterns familiar to the building. Each of the five-story additions feature generous indoor public gathering space for use by all building occupants. All four additions are designed to achieve LEED-NC Silver; the B-C and F-G additions have received certification.

Flad Role Full architectural services | **Size** 189,900 square feet (new), 17,300 square feet (renovation) | **Completion** 2012-2019 | **Awards** 2014 AIA WI Honor Award

The faculty at the University of Alberta envisioned adding a world-class, interdisciplinary science center to their campus – an educational home for the scientific, business, and community leaders of tomorrow. The university selected Flad Architects, in joint venture with ONPA, to design the Centennial Centre for Interdisciplinary Science (CCIS). The CCIS is a multi-functional facility of nearly 600,000 square feet carefully sited in the heart of the university's historic Quadrangle. Research and instructional spaces support science disciplines including physics, chemistry, astronomy, earth and atmospheric science, nanotechnology, proteomics, biological science, and geoscience. The CCIS has been awarded LEED Canada-NC Silver as administered by the Canadian Green Building Council.

Flad Role Architectural and interior design, programming, instructional and laboratory planning lead through design development; continued involvement through construction administration | **Size** 590,700 square feet | **Completion** 2011 | **Awards** 2013 AIA Wisconsin Merit Award, 2013 IIDA Wisconsin Award of Excellence

Bindley Bioscience Center (BBC) A cornerstone of Purdue's Discovery Park, the BBC serves as the functional anchor of this new life sciences complex. Advancing the concept to get products and ideas out to the market early, BBC leverages Purdue's life science and engineering foundation by supporting a consortium of academic institution and private industry. The wide range of initiatives includes genomics, proteomics, bioinformatics, instrumentation development, medicinal chemistry, and electrical and computing engineering.

Multidisciplinary Cancer Research Facility (MCRF) The MCRF is a 29,000-square-foot addition to the BBC and co-locates investigators from diverse departments and disciplines, extending research in biophysical, biomolecular analysis, conventional cell imaging and separation, and high throughput technologies.

Flad Role Full architectural services | **Size** 54,000 square feet (Bindley Bioscience Center), 29,074 square feet (MCRF Addition) | **Completion** 2005 (Bindley Bioscience Center), 2013 (MCRF Addition)

As an extension of the existing Ray W. Herrick Laboratories, the Center for High Performance Buildings expands Purdue's evolving multidisciplinary studies that comprise over 50 years of research with an emphasis on the transfer of technology concepts to industry use. A significant portion of this research focuses on solving problems related to the properties of built environments. Facilities within the new center are designed for the study of complex societal issues such as rising energy consumption and environmental pollution, climate change, public health, comfort and security, and issues associated with an aging population. The center itself received LEED Gold certification while maintaining the ability to research technologies beyond LEED criteria to support advancement of green building concepts for the future.

Flad Role Full architectural services | **Size** 64,000 square feet | **Completion** 2013

Healthcare Projects

UW Health expanded with a new healthcare campus in order to meet growing community needs. The new campus is on 42 acres at The American Center business park on Madison's Far East Side, approximately 12 miles from the main UW Health campus. The new hospital, universal care center, clinic building, and sports/wellness facilities for UW Health provided the opportunity to create a new healthcare center in a completely different way – applying patient-focused care models and efficient flows and operations based on Lean principles, with orthopedic medicine and healthy lifestyle as the mission.

Flad Role Full architectural services, medical planning, programming, and site planning | **Size** 500,000 square feet | **Completion** 2015 | **Awards** LEED Gold; USGBC Wisconsin Leader Awards, Award of Merit – Innovative Design, New Construction; IIDA Wisconsin, First Place – Healthcare; Wisconsin Chapter ASLA, Award of Excellence; Structural Engineers Association of Wisconsin, Excellence in Engineering Award – Large Project; In Business Magazine Commercial Design Award, Best New Development or Renovation – Healthcare; The Daily Reporter, Top Projects of 2015

Although they are the largest academic health system in Florida, accommodating the region's expanding patient population is becoming a challenge for UF Health. With heart disease as the leading cause of death in the U.S. and one in six Americans suffering from a neurological disease, UF Health is experiencing high patient volumes and an increased demand for beds and services. To answer this demand, the healthcare system built a new specialty tower to consolidate and align UF Health's cardiac and neurology services in an integrated facility that improves physician collaboration, efficiency, and patient therapy. The new tower is located on UF Health's south campus, next to the UF Health Shands Cancer Hospital, which was also designed by Flad. The facility provides state-of-the-art care to patients with neurologic, neurosurgical, heart, or vascular conditions.

Flad Role Full architectural services, master planning, medical programming, structural engineering, landscape architecture, and interior design | **Size** 520,000 square feet | **Completion** 2017 | **Awards** 4 Green Globes

Recognizing the expansion challenges of their current site, UF Health purchased 30 acres of land across the street. Flad worked extensively with UF Health leadership to develop a multi-phased master plan to grow the hospital system on the new academic medical campus to 1,200 beds over the next 20 to 25 years. For Phase I of the master plan, Flad designed a state-of-the-art, cancer center to provide the latest treatments being developed by researchers at UF, creating a true bench-to-bedside therapy for oncology patients. The new, eight-story cancer hospital houses 192 acute and critical care beds, a Level I Trauma Center, imaging, and diagnostic and interventional services to support the patient care units.

Flad Role Full architectural services, master planning, medical programming, structural engineering, landscape architecture, and interior design | **Size** 500,000 square feet | **Completion** 2009 | **Awards** LEED Gold; American School & University Magazine 2010 Educational Interiors Showcase, Outstanding Design; Southeast Construction Magazine Best of 2010, Best Healthcare Project; 2011 IIDA Wisconsin, First Place, Healthcare; 2011 AIA Florida/Caribbean Honor & Design Awards, Merit Award

In its ongoing community commitment to provide the highest quality of care at the lowest cost, Genesis Health System underwent a multi-phased renovation and expansion project to improve the care they provide to patients and their families. Phase I of a master plan, also conducted by Flad, is the design and construction of a seven-story hospital addition located in the open area between an existing parking ramp and the existing hospital building, connecting all three structures. The addition includes 96 acute care general and orthopedic surgery beds, 16 ORs, and a new PACU. It also incorporates a number of features that increase efficiency and flexibility of hospital operations enabling the new facility to implement patient-centered care concepts and take advantage of advances in technology and care delivery. Lean techniques were used in the implementation of re-engineered patient care processes to promote greater efficiencies.

Flad Role Full master planning, medical programming, architectural, structural engineering, landscape, and interior design services | **Size** 320,000 square feet | **Completion** 2017

The Medical College of Wisconsin (MCW), in partnership with Froedtert Hospital, is striving to enhance patient access and care delivery on their Milwaukee Regional Medical Center (MRMC) campus with a new eight-story Hub for Collaborative Medicine. The new building creates a collaborative work environment that joins the Medical College Physician (MCP) practice, previously fractured across the MRMC campus, and strengthens the MCW's competitive advantage for retention and recruitment of world-class faculty and physicians. The design of the new Hub creates efficiencies through proximity and adjacencies and provides flexible workspaces, shared resources, and collaboration among departments and programs, and incorporates technology to connect staff and faculty. By consolidating over 1,200 faculty and staff to the new office complex, the vacated facilities can be repurposed to provide new and improved patient care spaces.

Flad Role Full architectural services | **Size** 310,000 square feet | **Completion** 2018

Lee Health at Coconut Point is a health and wellness destination for residents of Florida offering a broad array of medical services across the continuum of care in a pleasing campus environment / retail setting to create an enhanced patient experience and healing environment. Flad completed the master plan of the 31-acre site to accommodate a phase one development as well as a long-range master plan for future buildings that will eventually include 80 inpatient beds. The site is central to several existing residential areas, new senior housing facilities, regional shopping, restaurants, and outdoor resources. The phase one, 146,000-square-foot building will include a healthy life center for holistic health and care coordination services, an outpatient surgery center, a freestanding ED, a recovery care center/clinical decision unit with observation beds, laboratory, imaging, rehab therapy, cardiac testing, and physician office space.

Flad Role Master planning, medical planning, and full architectural services | **Size** 146,000 square feet (phase 1 building); 31-acre master plan | **Completion** 2018

University of Wisconsin doctors, nurses, and other health professionals can practice their skills and test their knowledge in real-world settings with no risk of harm to patients or practitioners thanks to the UW Simulation Center housed within the UW Hospital and Clinics. The center creates a single home for simulation training programs that were previously scattered across different departments and schools. The center includes four main flexible, high fidelity simulation rooms that are grouped in pairs, with each pair organized around a shared control room. The concept of a shared control room optimizes the use of space and resources and allows for direct viewing from control areas into all simulation rooms.

Flad Role Full architectural services | **Size** 6,500 square feet | **Completion** 2011

In an effort to better serve local residents, UW Health opened two, new family medicine clinic in Cottage Grove and Fort Atkinson, Wisconsin. Replacing outdated facilities, the new medical buildings feature a patient-centered team approach to improve quality of care and patient outcomes. Patients are first welcomed to the clinics with a drop-off canopy accented with indigenous stone pillars and enter through a vestibule of clearstory windows. Once inside, the reception and waiting areas feature sloped wood ceilings, a wood-toned reception desk, self-check-in kiosk flanked in frosted glass for privacy, and a soaring glass wall for an abundance of natural daylighting. The design goal for the building was to enrich the patient's experience by creating a comforting environment while incorporating a new self-rooming concept to help alleviate patient wait times and maximize efficiency.

Flad Role Full architectural services | **Size** 14,000 square feet (Cottage Grove); 19,000 square feet (Fort Atkinson) | **Completion** 2015 (Cottage Grove); 2016 (Fort Atkinson) | **Awards** IIDA Wisconsin, First Place – Healthcare (under 15,000 sf) (Cottage Grove Clinic)

Science & Technology Projects

CONFIDENTIAL CLIENT Georgia Manufacturing Facility

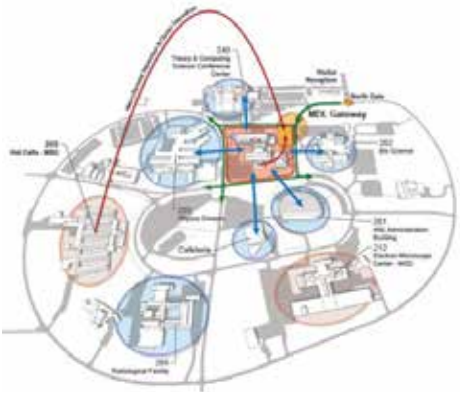

This state-of-the-art, 1.2 million-square-foot biotech manufacturing campus integrates the technical requirements of both upstream and downstream manufacturing, while providing a work environment focused on the well-being and efficiency of a diverse and highly dedicated workforce with a shared mission: to deliver plasma-based therapies for people affected by rare diseases and other highly specialized conditions. Flad's design includes cGMP manufacturing units, warehouse and freezer storage, two testing laboratories, a 300-person administration building, and a central commons with a cafeteria, gym, and training rooms.

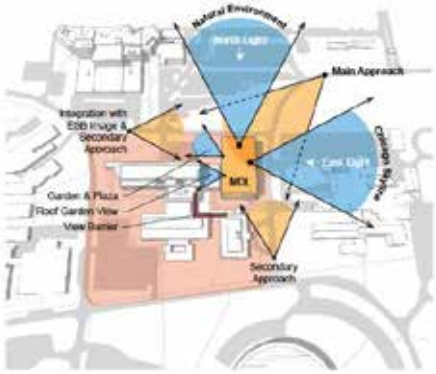

Flad Role Full design and process architectural services | **Size** 1,200,000 square feet | **Completion** 2016 | **Awards** 2015 Construction Users Roundtable (CURT) CISE Safety Excellence Award for US Projects

ARGONNE NATIONAL LABORATORY Materials Design Laboratory

The Science Laboratories Infrastructure Program within the U.S. Department of Energy's Office of Science will invest $95 million in the construction of a new Materials Design Laboratory (MDL) at Argonne National Laboratory located in Lemont, Illinois. Argonne's mission of conducting advanced research is promoted by the ability to retain and attract the world's top scientific minds. The new MDL will house approximately 170 researchers dedicated to creating new materials and molecules that address the world's most critical energy problems. The MDL will not only be the first building that visitors encounter on the Argonne site, therefore becoming the gateway to Argonne, but it will also be the piece that completes Argonne's energy quad, consolidating and collocating a 700+ research community. The success of this research community hinges on a transparent environment that enables collaboration, promotes communication, and is flexible to accommodate the ever-changing requirements of the scientific workplace.

Flad Role Full architectural services | **Size** 128,000 square feet | **Completion** 2018

BROOKHAVEN NATIONAL LABORATORY Renovate Science Laboratories Phase 1 (RSL-1)

For more than 60 years, Brookhaven National Laboratory has been one of the nation's – and the world's – leading research institutions. Much of the lab's effort is directed at the study of the basic nature of matter, including subatomic particles and the structure of the atom. In order to align the facilities with this world-class scientific research, the laboratory has concluded the first phase of an ongoing effort to modernize their existing research facilities, including materials science and fuel testing laboratories, with the completion of renovations to Buildings 480 and 815. The research performed in these laboratories supports cutting-edge investigations into some of the most important questions facing the Department of Energy today. This encompasses several promising areas of renewable energy science, including photovoltaic cells, wind energy, and biofuels. In addition, materials science researchers are investigating ultra-sensitive trace technologies to provide portable and durable instrumentation to detect hazardous and potentially dangerous materials.

Flad Role Full architectural services | **Size** 26,000 square feet | **Completion** 2011

As the design architect and architect of record, Flad collaborated with the laboratory architect, Johnsrud Associates, for this project that includes a new, three-story research and development lab building. Flad also provided design services for the renovation of an existing adjacent and integrated research building. These projects combine the numerous research activities of the Johnson & Johnson Pharmaceutical Research Division into a collaborative, state-of-the-art environment. Chemistry, biology, and analytical labs are mixed on each floor to promote multidisciplinary research. Specific laboratory types in these facilities include chemistry, biology, and radiosynthesis. They have been combined in a strategic attempt by Johnson & Johnson to bolster the working relationships between these different organizations and to create multifunctional teams to solve the full range of challenges related to drug discovery and development.

Flad Role Design architect and architect of record | **Size** 155,000 square feet (new); 105,000 square feet (renovation) | **Completion** 2010 | **Awards** LEED Gold; 2009 CMAA Project of the Year Awards-Chairman's Award; 2009 J&J Worldwide Sustainability Award

Mayo Clinic expanded clinical testing functions at its existing 225,000-square-foot support facility where current operations include specimen receipt, processing, and accessioning. Positioned on the south side of the existing facility, this 70,000-square-foot, two-story expansion houses clinical testing reference and development laboratories, laboratory support functions, offices, and building amenity and ancillary support. Programmatic components are organized to optimize adjacencies of an open and flexible lab concept, with each space located to support Lean operations. Material, sample, and personnel flows were carefully considered for seamless and efficient integration with a Lean operational framework.

Flad Role Full architectural services | **Size** 70,000 square feet | **Completion** 2015

BOEHRINGER INGELHEIM PHARMACEUTICALS, INC. Building 10

Curving gracefully with the natural contours of the site and offering views of the rolling Connecticut hills, this new laboratory facility consolidates functions and allows additional staff to sustain a successful research program. A three-story, light-filled atrium connects three buildings and provides a strategic interaction hub for scientists in Boehringer's research division. This welcoming entrance serves as a gathering place for the research division of the campus offering a café and conference space. As Boehringer's worldwide Center of Excellence in cardiovascular research, Building 10 houses medicinal and structural chemistry and biology laboratories. Researchers at this facility work to find treatments to help the millions of Americans who have been diagnosed with cardiovascular disease. The project consolidates various departments and functions, accommodating planned growth, and supporting an efficient, collaborative scientific environment.

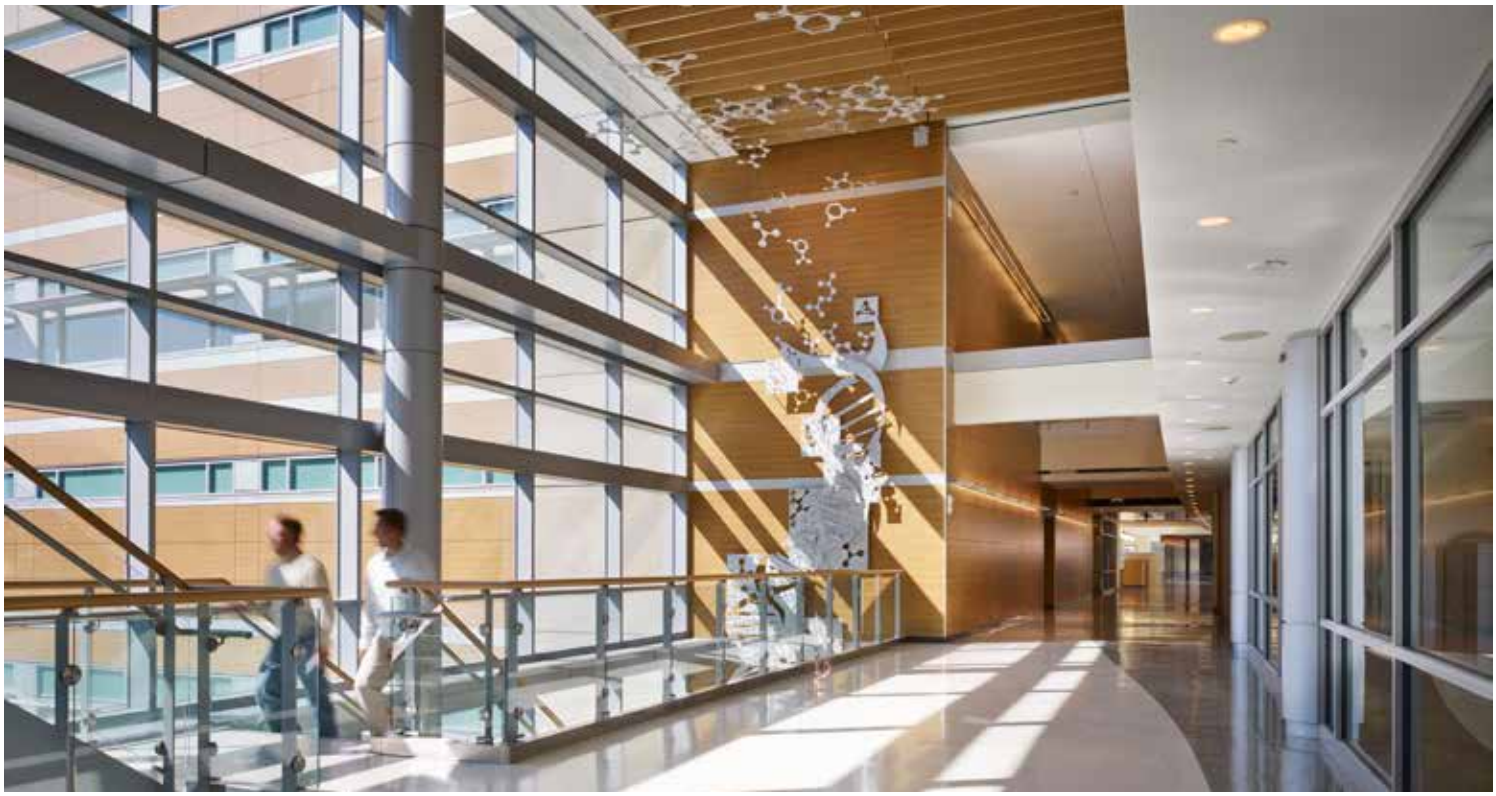

Flad Role Master planning, full architectural services | **Size** 98,000 square feet | **Completion** 2009 | **Awards** IIDA Wisconsin, First Place, Office/Corporate

The Department of Homeland Security (DHS) identified the need to establish an integrated research, development, test, and evaluation countermeasure program for potential bio- and agro-terrorism threats as well as naturally occurring foreign and animal diseases. To meet these needs, the National Bio and Agro Defense Facility (NBAF) will be an integrated foreign animal and zoonotic disease research, development, and testing facility that allows for research to enhance agricultural and public health. The new building provides modern, safe, and secure biocontainment laboratories of sufficient capacity for operations that include the licensure of animal disease vaccines; defending against high-consequence foreign animal diseases in livestock; and providing the essential infrastructure requirements for threat characterization, forensics, and detection.

Flad Role Joint Venture partners Flad Architects and Perkins + Will share leadership of this project, providing full architectural services | **Size** 520,000 square feet | **Completion** 2020

USAMRICD is the lead laboratory within the Department of Defense for medical research focused on chemical defense. Their mission is to develop medical countermeasures for warfighters and civilians and train personnel in the medical management of casualties related to chemical agents exposure. USAMRICD's vision is to be the recognized Center of Excellence, a national asset, and the world leader for medical chemical defense, education, and training. Program validation was conducted for a full replacement facility which included development of a department-level program and concept of operations plan to support the needs of the USAMRICD command, administrative, and science divisions in conjunction with the relocation of staff positions from Walter Reed Army Institute of Research (WRAIR) as directed by the 2005 Base Realignment and Closure. The unique design solution collocated biomedical, animal procedure/ holding, and chemical confinement laboratory capabilities into a single, integrated facility.

Flad Role Full architectural services | **Size** 526,000 square feet | **Completion** 2015

Corporate Workplace Projects

Sentry's new office building expands and enhances the company's main campus. Located diagonally across the street from Sentry's main headquarters building, also designed by Flad, the seven-story, 270,000-square-foot building is designed to reflect the company's progressive attitude toward the nature of the work and the character of the workplace. The first floor provides access for staff and visitors, engaging them in a light-filled, two-story lobby space with views across an exterior terrace that frames the corporate headquarters in the distance. A central, six-story atrium links the south and north wings of the building and includes a large kitchen, servery, cafeteria, lounge, and coffee bar. Level two houses flexible training spaces, a fitness and wellness program, and health services. Primary office functions are housed on levels three through six, with each level organized around two equally sized open-plan office wings. The seventh floor accommodates large events and national account meetings with large, flexible meeting rooms, dining services, and a variety of indoor and outdoor breakout spaces including a terrace with gardens.

Flad Role Full architectural services | **Size** 270,000 square feet | **Completion** 2018

An independent, non-profit organization, ACT is among the nation's leaders in developing and administering assessments that help individuals achieve their educational and career goals. Flad Architects collaborated with ACT to design the project including a stand-alone, two-story office building; an adjacent amenities building that houses meeting and training rooms; and a full-service, 300-seat cafeteria, wrapped around a landscaped terrace. Linked by pedestrian routes, buildings are clustered around a central courtyard that defines a formal outdoor space and creates a social center at the heart of the campus.

Flad Role Full architectural services | **Size** 170,000 square feet | **Completion** 2003

CENTRAL INSURANCE Corporate Headquarters

When Central Insurance outgrew the 1975 addition to its original office, the president of the company knew that he needed substantially more space, not simply a stop-gap measure. Instead, the renovation and expansion would be a statement about the company's future possibilities. With the help of Flad Architects, Central Insurance added on and transformed the 1931 and 1975 structures, creating an overall campus feel that paid homage to the original architecture, equipping the corporate headquarters with ample office space, staff amenities, technology, and an outlook for a new era in the company's history. The building complex was expanded with three-story "T"-shaped additions that house office space, conference and meeting rooms, training rooms, support spaces, expandable break rooms and food service areas, relocation of the IT functions, expansion of building support functions, and expansion of utility systems necessary to support future growth.

Flad Role Full architectural services | **Size** 170,000 square feet | **Completion** 2007 | **Awards** Best of Competition, IIDA Wisconsin Interior Design Competition

CHURCH MUTUAL INSURANCE Office Renovation

A long-term client of over 40 years, Flad has provided Church Mutual Insurance with planning and design services for the company's corporate headquarters from original design through two expansions and several ongoing renovations. In need of a solution for both a near-term shortage of conference space and accommodation of long-term staff growth, a master plan was conducted to identify strategies, resulting in the decision to convert a former retail facility into an open office concept. The structure selected for renovation presented the design team with a number of challenges – foremost among these were segmenting a vast, uninterrupted floorplate of 70,000 square feet and creating interest within a windowless environment. To help with orientation throughout the space, a hierarchy of different wall and partition heights help organize the 'city scape' into neighborhoods and provide directional cues. Vibrant colors and strategic floor patterns also aide in navigation while creating interest throughout.

Flad Role Full architectural services | **Size** 70,000 square feet | **Completion** 2015

Flad Architects

Flad Architects has earned a reputation for outstanding client service, fiscal responsibility, and design excellence over its 90-year history. Specializing in the planning and design of innovative science facilities for academic, healthcare, government, and corporate science and technology clients, Flad is nationally known and honored for its planning and design expertise. In addition to traditional architectural services, Flad provides strategic facility planning and programming, laboratory planning, interior design, landscape architecture, and structural engineering.
